

## What corrections did you have to make?

We added alternative text to user profile images & post images and added aria-label to the comment field.

## Given that the photos and captions rely on user-generated content, do you think that the accessibility problems are all solvable? Why or why not?

At the moment, a lot of accessibility problems aren't solvable immediately. However, there are several options to solve some of them. For example, offering users the ability to insert alt text when uploading their post may help self-label the content of the image. Likewise, machine learning algorithms may soon be able to accurately label the content of images, increasing the accessibility of the entire web. Therefore, while it may never be 100% accurate, I believe it is reasonable to expect accessibility to increase as these technologies as well as the focus on accessible content increases as well.

## Do you think your website is usable if you turn off the CSS? Why or why not?

Turning off CSS would likely make the website unusable. There is no separation of content between one card and the next, and content such as the recommendations panel is on the bottom of the screen. Although with enough effort a user may be able to find the pattern & intended structure, ultimately it is not user friendly and it's doubtful anyone would spend that much effort.

## Do you think your website is usable if you turn off the images? Why or why not?

Turning off images would disable the stories functionality of the website, because the picture is the clickable element in the story. However, cards, comments, and would still be usable, although without the alternate text for the post image, little use for the website exists.
